

Color Guide

A simple guide to the colors used, and what each one means.

1. Primary & Secondary Colors

These are the main colors used across the app for buttons, links, and highlights.

Primary Color — Blue

Blue is our main color. It is used for links, buttons, and important actions.

Secondary Colors

These extra colors are used for special tags and labels, mostly in the clinic admin screens. Active Status Blue is the text color for Open and Active states on tickets and incidents (for example an Open ticket or an Active incident).

Neutral Colors

Grays are used for backgrounds, borders, and regular text that isn't a color status.

2. Semantic Colors

Semantic colors have a fixed meaning everywhere in the app. Green always means "good," orange always means "warning," maroon always means "error, critical or escalated," red always means "patient priority," and

so on. Each color has three versions: a solid color (for icons and dots), a text color (easier to read), and a light background (for badges).

Green — Good / Success

Green means everything is fine: data is complete, a task is done, or the answer is "Yes."

Orange — Warning

Orange means something needs attention: data is low, a dose was missed, the answer is "No," or a task is still in progress. This is a deeper, more saturated "Professional Orange," kept clearly apart from the Amber Yellow below so the two are never mistaken for each other.

Maroon — Error / Critical / Escalated

Maroon means something is wrong or urgent on the system side: a system error, a failed action, invalid input, a Critical severity, or an Escalated ticket or incident. It's a deep, muted red — distinct from Priority Red and from the Orange warning tone — so it never gets mistaken for a patient's Priority status or a simple warning.

Red — Patient Priority

Red is reserved for patient Priority status only. It is not used for system errors, Critical severity or Escalated items — those use maroon.

Yellow — Medium Caution

Yellow sits between orange and gray. It marks things that are medium priority — not urgent, but not fine either. This "Amber Yellow" is a clear, bright gold, kept apart in hue and brightness from the Professional Orange warning tone above so the two are never mistaken for each other.

Gray — Disabled / Not Available

Gray means something is turned off, not filled in, or not clickable.

3. Badges & Status Pills

Badges and status pills are the small rounded labels that show a patient's or task's status at a glance. They use a light background color with matching darker text from the semantic colors above.

Color	Status	What it means
	Active / Completed / Resolved	Green background, green text. Everything is good — e.g. an Active patient, user or organization.
	Open / Active (Tickets & Incidents)	Light blue background, Active Status Blue text. A ticket or incident that is open and being worked on.
	Pending / In Progress	Orange-tinted background, orange text. Waiting or needs action.
	Patient Priority	Red background, red text. A patient in Priority status. Red is used for this only.
	Critical	Maroon background, maroon text. The highest severity/priority on a ticket, incident or rule.
	Escalated	Maroon background, maroon text. Sent to a higher level — treated as urgent, same as Critical.
	Error	Maroon background, maroon text. A system error or failed action.
	Medium Priority	Yellow background, yellow text. Somewhat important.
	Low Priority / Archived	Light gray background, gray text. Not urgent.

Quick rule of thumb: green = good, blue = open/active ticket or incident, orange = warning or in progress, maroon = error, critical or escalated, red = patient priority only, yellow = medium, gray = low or inactive.
